Valuable Aid to Research Personnel. New Design of

Roller Bearings,

PERIODICAL: Technické noviny, 1960, No.41, p.5

On the basis of extensive theoretical and experimental work at the Vyzkumný ústav valivých ložisek (Antifriction Bearing Research Institute), a new favourable shape of the active surfaces was designed which ensures uniform stress distribution and thus also the possibility of applying larger pressures. The surfaces of the rollers are slightly curved, whereby the radius of curvature has a certain accurate relation to the races. The longitudinal profile deviation of the rolls amounts to a few thousandths of a Simultaneously, millimetre and depends on the roller dimensions. a perfect and economical method of manufacturing these rollers was Tests proved that all these measures enabled increasing the loading by 40% and treble the service life if there is no increase in the load. Lubrication is improved, as a result of which the friction and the operating temperature are reduced. These bearings allow a certain eccentricity of the races and slight pre-tensioning. The practical relevance is that lighter bearings can be used for the Card 1/2

Z/006/60/000/041/002/006 E073/E535

Valuable Aid to Research Personnel. New Design of Roller Bearings same machinery. Furthermore, the shape of the roller bearings is such that a moderate elastic deformation is permissible. Therefore, they can run with a certain amount of pre-tensioning, as a result of which a higher rigidity and accuracy of the running of the rotation system is achieved, which is particularly useful in the case of machine tools. Furthermore, for the new bearings a certain amount of eccentricity is permissible, i.e. eccentricity caused by the sag and dilatation of the shaft.

Abstract

Three different technological processes for the manufacture of the above-stated paper have been tested. The requirements which must be met by such paper are considered, as well as the methods of determining its physical

and mechanical indices.

TITLE: Use of expanding pearlite as a thermal insulating antipipe compound for curing killed steel ingot tops	
SOURCE: Hutnicke listy, no. 3, 1965, 163-169	
TOPIC TAGS: pearlite, steel, thermal insulation, heat conduction, heat loss	
ABSTRACT: Forms of heat losses in killed steel ingot tops are described; suitable thermal insulations preventing these important heat losses are discussed. Conductivity of such materials should not exceed 0.080 Kcal/°C m.h.	
The Slovak expanding pearlite meets the requirements for such materials. In a series of 155 heats and 3438 ingots technological and economical advantages of using the expanding pearlite instead	
of exothermic mixtures were proved. Total economies achieved are on the order of 4 Kcs per ton of steel. The authors thank Engr. L. Smrha, Candidate of Sciences, for participation and the workers of NHKG for assistance with the carring out of the research work. Orig. art. has: 10 figures and 2 tables. [JPRS]

TITLE:

The Application of Gas Chromatography in the Research on Synthetic

Rubber

PERIODICAL: Przemysł Chemiczny, 1960, Vol. 39, No. 9, pp. 552 - 555

TEXT: The paper was submitted in Czech language by the Institute of Synthetic Rubber Research at the Kaucuk Works in Gottwaldowo. It was translated into Polish by Albin Pass. The purpose of this paper is to inform Polish readers on the application of gas chromatography in synthetic rubber research, which has been developed and employed by this institute since 1956. The setup for gas chromatography is briefly described and illustrated in Figures 1 through 4. Methods for the determination of butadiene, isoprene and chloroprene contents are given. The reader is referred to the bibliography listed for detailed description of equipment, methods and results of investigations. There are 7 figures and 25 references: 16 Polish, 7 Czech and 2 English.

Investigating pitting corrosion of metals under stress

by modelling

PERIODICAL: Zhurnal prikladnoy khimii, v. 33, no. 10, 1960, 2285 - 2290

TEXT: The influence of the following factors on the direction and strength of current of specific corrosion couples was studied by modelling: tensile stresses, degree of stress concentration and diameter of pits. The influence of stresses on the electrode potential of the cathodic and anodic areas and the degree of polarization of the anodic areas of these couples were also investigated. The aluminum alloy D-16 (2.5 % Cu, 1.66 % Mg, 0.9 % Pe, 0.62 % Mm, 0.47 % Si, remainder Ai) was used for this study, since it is known that this alloy is susceptible to pitting corrosion and stress corrosion in a number of media. In order to set up stresses in the metal, the assembly of specimens was held in the grips of a device, Card 1/3

25064 8/080/60/033/010/016/029 D216/D306

Investigating pitting corrosion ...

by means of which all specimens were simultaneously subjected to unlaxial stress. The specimens were electrically insulated from the grips. In order to model stress concentrations, the width of the lower specimens was made less than that of the upper specimens which for identical loads, produced different stress levels in the upper and lower specimens. A cross section of the pit model is given. The current was measured by means of a micrometer graduated in µA, connected between the upper and lower specimens at the moment when current measurements were taken, after which the specimens were short-circuited through the external circuit. The electrode potential was measured by means of a glass probe of 0:12 mm internal diameter in a pit having a diameter of 1.1 mm. The measurements were carried out by the compensation method with reference to a saturated calomel half cell. The potential values were computed with reference to the normal hydrogen electrode. The measurements were carried out at the bottom and at the edges of pits. The glass probe could be moved by means of a micrometer screw. For polarization measurements, a platinum wire of 0.1 mm diameter, one

Card 2/3

Investigating pitting corrosion ...

winding of which was placed in the glass container above the pit opening, was used as the auxiliary electrode. An appropriate electrical set-up was used for supplying the required current densities. The specimens were given the same preparation prior to electrochemical measurements as that given prior to corrosion current measurements. The following relationships were investigated and are represented graphically: current-time for various stresses; potential-time for various stresses and potential-current density. The results obtained confirm the electrochemical hypothesis on the mechanism of stress corrosion of metals which postulates the local formation of specific corrosion couples which are responsible for cracking, and a characteristic influence of stress concentrations on the reactions of the corrosion couples. TITLE:

On the Lindenbaum theorem on complete hypersystems

PERIODICAL:

Referativnyy zhurnal, Matematika, no. 7, 1962, 14,

abstract 7A66. ("Stud. log.", 1961, 12, 83-98)

In the general theory of deductive systems according to Tarski an arbitrary set S with a function c defined on it (denoted as TEXT: consequence) is considered, which satisfies the following conditions: for arbitrary X, Y C S

1) X C CX C S,

2) from X C Y follows cX C oY

4) if $\alpha \in \alpha x$, then a finite Y C S exists such that Y C X and $\alpha \in \alpha x$.

The set X C S is called a) c-system, if cX = X; b) c-consistent, if $cX \neq S$; c) c-complete, if for every $a \in S$ either $a \in cX$ or $c(\{a\}+X) = S$. One of the main results of the mentioned theory of Tarski is the Lindenbaum theorem; if (1) S is at most denumerable and (2) an $\infty \in S$ exists such that $c \{ x \} = S$, then to every o-consistent X C S there exists a Card 1/3

S/044/62/000/007/001/100 C111/C333

On the Lindenbaum theorem on . . . C111/C555

c-consistent c-complete c-system Y \(\) S such that X \(\) Y.

In the paper reviewed the following theorems are proved:

T. There exists a denumerable set S and a function c which is a consequence in S such that no o-consistent c-system of S can be embedded into no c-consistent c-complete o-system of S.

There exists a non-empty with respect to the enclosure ordered family of consistent c-systems such that the union of all the elements of this family forms a c-non-consistent c-system. From theorem T follows that the demand of the finite axiomatizability of S (i. e. the condition (2)) is essential in the Lindenbaum theorem. The ordered pair $< 2^{M}$, f > is denoted as consequence algebra, where 2^{M} is the set of all subsets of the given set M and f is a consequence in M. Two algebras $< 2^{L}$, $f > and <math>< 2^{M}$, $g > are called isomorphic, if there is a one-to-one mapping <math>\varphi$ of 2^{L} on 2^{M} such that $\varphi' f X = g \varphi X$ for every $X \subseteq L$.

Card 2/3

s/044/62/000/007/001/100 C111/C333

Examples of classes of consequence algebras, which are isomorphic to the consequence algebra $< 2^S$, c > are constructed in the paper (this latter one was constructed for the proof of theorem T_1).

Abstract

Phage Vi-1 multiplied on cultures of Salmonella typhi, which contain Vi-antigen (phagolysate FTy), and also on a culture of E. freundi, in which this antigen is absent (phagolysate FEf). Phagolysate FEf can cause decomposition of Vi-antigen only to a minor degree, while the phagolysate FTy gave rose to marked decomposition of this antigen. The above-mentioned phages differed from one another by the speed of their elution from erythrocyte surfaces which were sensitized by Vi-antigen. Phage

FTy eluted rapidly -- in 0-30 minutes; phage FEf did not elute in the first 4 hours. The data obtained show that the host cell exerts a substantial influence on the synthetic course and the properties of virus particles. The method of phage titration is given in the supplement, which represents an original modification of the Khorvat-Alfeldi method.

Waccination Against Influenza in Hungary, 1961-1962"

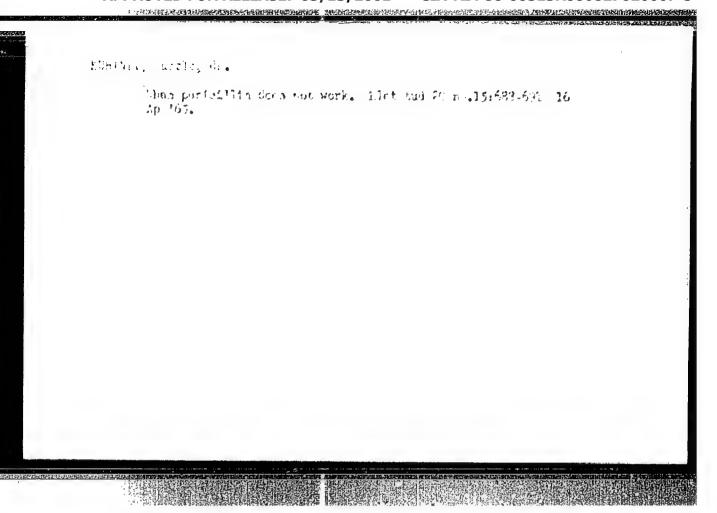

Budapest, Acta Microbiologica Academiae Scientiarum Hungaricae, Vol 9, No 4, 1962/63; pp 381-390.

Abstract [Article in English; authors' English summary]: The effectiveness of immunization with a subcutaneous influenza A-2 vaccine was estimated by the observation of 13,321 vacciness and 24,455 control subjects. In the course of an influenza A-2 epidemic 3-4 months after the vaccinations 36.9% of the controls and 16.9% of the vacciness contracted the disease. In the vaccinated group the average period of nursing was 40% shorter than in the control patients. Some features of the 1962 influenza epidemic which affected 23% of Hungary's population, are described. [Two Hungarian references].
